Example 3 with output

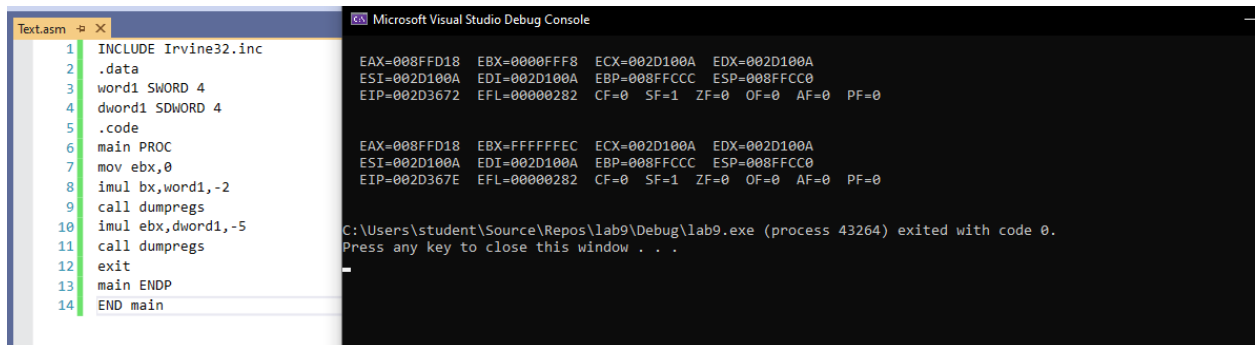

The screenshot shows the Visual Studio IDE with a file named `Text.asm` open. The assembly code is as follows:

```
1 INCLUDE Irvine32.inc
2
3 .data
4 val1 WORD 2000h
5 val2 WORD 0100h
6
7 .code

Basic IMUL Example with output

The screenshot shows the Visual Studio IDE with a file named `Text.asm` open. The assembly code is as follows:

```
1 INCLUDE Irvine32.inc
2 .data
3 word1 SWORD 4
4 dword1 SDWORD 4
5 .code
6 main PROC
7 mov ebx, 0
8 imul bx, word1, -2
9 call dumpregs
10 imul ebx, dword1, -5
11 call dumpregs
12 exit
13 main ENDP
14 END main
```

The Microsoft Visual Studio Debug Console displays the following register values:

| | | | |
|--------------|--------------|--------------|--------------------------|

CBW: Example with output

The screenshot shows the assembly code in the Text.asm editor and the output in the Microsoft Visual Studio Debug Console. The assembly code defines a variable `byteVal` of type `SBYTE` with the value `-101`. The `main` procedure moves `byteVal` into `al`, then uses the `cbw` instruction to sign-extend it into `ax`. The `dumpregs` instruction is called, and the program exits.

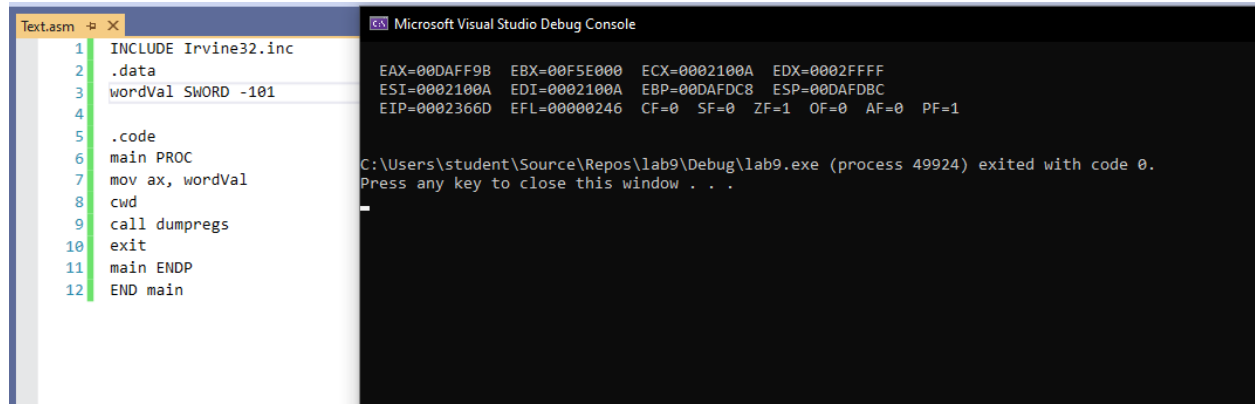

```
1 INCLUDE Irvine32.inc
2 .data
3 byteVal SBYTE -101

CWD: Example with output

The screenshot shows the assembly code in the Text.asm editor and the output in the Microsoft Visual Studio Debug Console. The assembly code defines a variable `wordVal` of type `SWORD` with the value `-101`. The `main` procedure moves `wordVal` into `ax`, then uses the `cwd` instruction to sign-extend it into `edx:eax`. The `dumpregs` instruction is called, and the program exits.

CDQ: Example with output

The screenshot shows the assembly code in the Text.asm editor and the output in the Microsoft Visual Studio Debug Console. The assembly code defines a variable `dwordVal` of type `SDWORD` with the value `-101`. The `main` procedure moves `dwordVal` into `eax`, then uses the `cdq` instruction to sign-extend it into `edx:eax`. The `dumpregs` instruction is called, and the program exits.

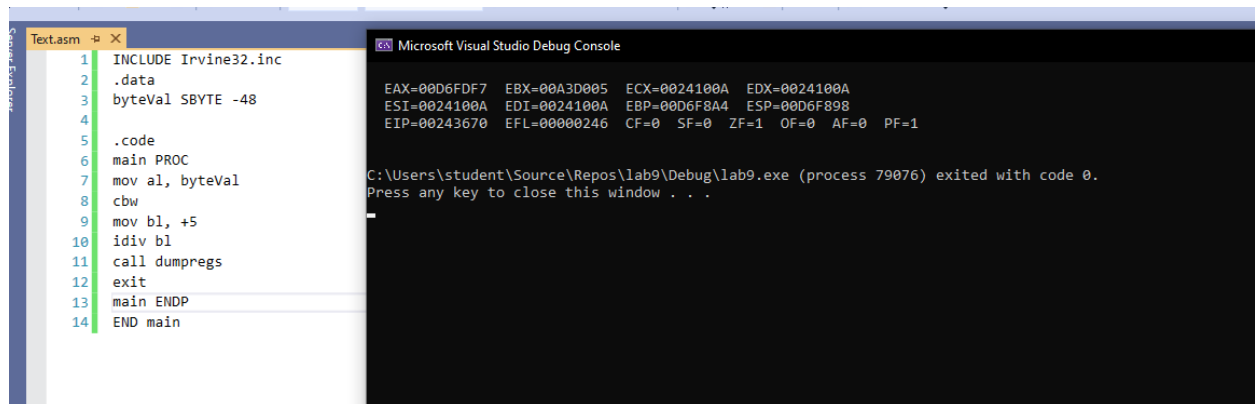

```

IDIV: Example with output

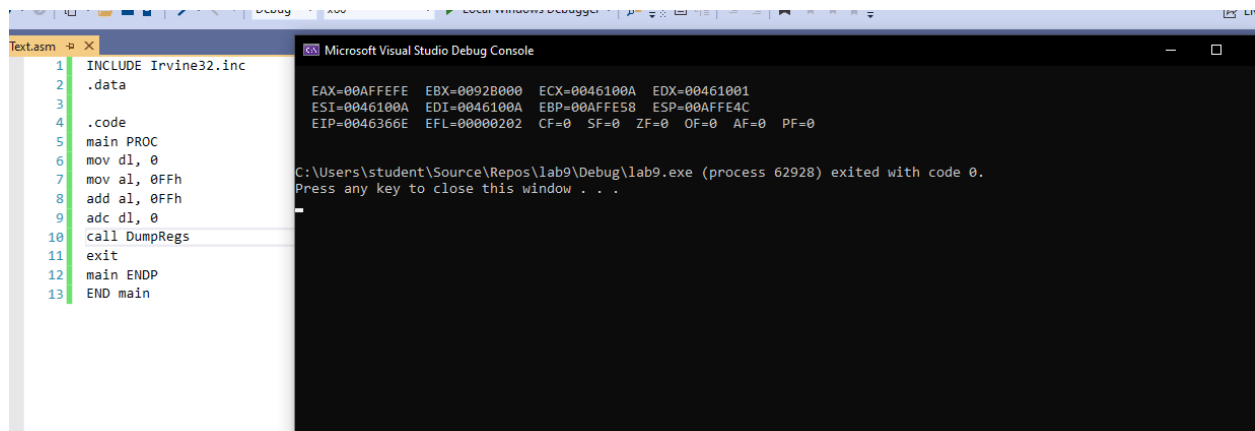

The screenshot shows the Visual Studio IDE with an assembly file named `Text.asm` and the Microsoft Visual Studio Debug Console. The assembly code defines a `main` procedure that moves a byte value `-48` into `al`, converts it to a word (`cbw`), increments `bl` by 5, and then performs a signed division (`idiv bl`). The debug console displays the initial register values and the exit message.

```
Text.asm
1 INCLUDE Irvine32.inc
2 .data
3 byteVal SBYTE -48
4
5 .code
6 main PROC
7 mov al, byteVal
8 cbw

adc: Example with output

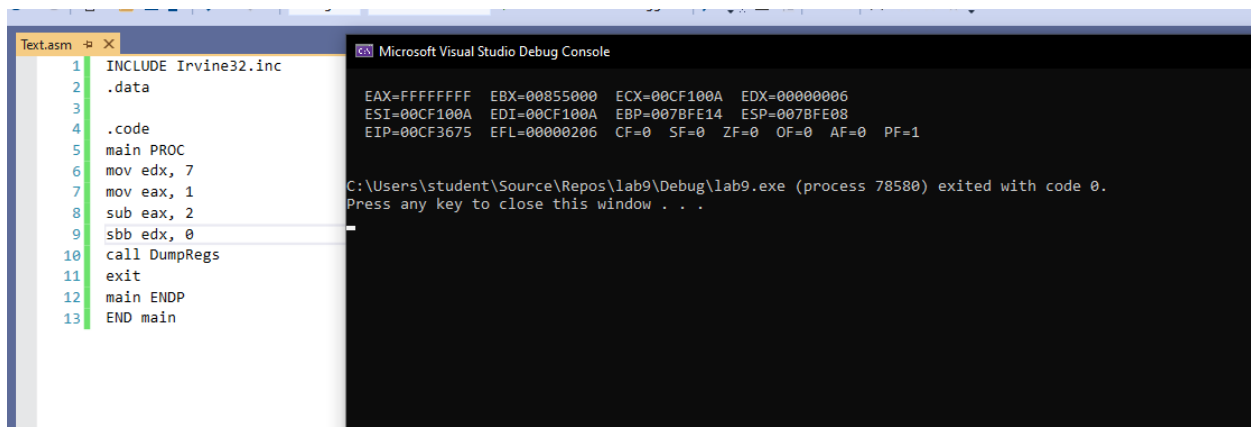

The screenshot shows the Visual Studio IDE with an assembly file named `Text.asm` and the Microsoft Visual Studio Debug Console. The assembly code defines a `main` procedure that moves `0` into `dl`, adds `0FFh` to `al`, and then performs an add with carry (`adc dl, 0`). The debug console displays the initial register values and the exit message.

```
Text.asm
1 INCLUDE Irvine32.inc

sbb: Example with output

The screenshot shows the Visual Studio IDE with an assembly file named `Text.asm` and the Microsoft Visual Studio Debug Console. The assembly code defines a `main` procedure that moves `7` into `edx`, moves `1` into `eax`, subtracts `2` from `eax`, and then performs a signed borrow subtract (`sbb edx, 0`). The debug console displays the initial register values and the exit message.

```
Text.asm
1 INCLUDE Irvine32.inc
2 .data
3
4 .code
5 main PROC
6 mov edx, 7
